

# CRESTRON'S CLEAN-ROOM SYSTEM MAKES IT EASIER AND SAFER TO RETURN TO WORK

## Clean, Safe Environments

As an employee, how do you know a space has been disinfected before you use it? Having a system that uses **Visual Indicators** makes it obvious to the users that a space is available, occupied, or needs to be disinfected. This provides end-users with information they need to move around their workspace with confidence.

TSW-770

- **Intuitive Touch Screen Interface** installs near the entrance of a meeting room to provide a clear indication of the "Clean State" status and meeting schedule.
- Facilities Maintenance can also utilize the screen to input a unique code/PIN once the room has been cleaned, placing the room in a usable state.
- Interface can be customized with indicator colors as well as text information for room name, number and in-use/availability information.

CEN-ODT-C-POE

- **Occupancy Sensor** monitors room utilization in real-time.
- Once room is vacant, a "Needs Cleaning" state is evaluated.
- If needed, an auto-notification is sent to facilities maintenance advising room needs to be cleaned.

SSW-102

- **Outside-Room Indicator** light can be custom color coded to visually notify employees that a room needs to be cleaned before the next meeting.
- Once room has been cleaned, the indicator will change colors advising employees that the room is now available.
